

## 1.1 HAWAII

### 1.1.1 DATA SOURCES

This report contains the most recently available information on Hawaii's commercial pelagic fisheries, as compiled from four data sources: The State of Hawaii's Division of Aquatic Resources (HDAR) Commercial Marine License data (CML), Commercial Fishing Report data (Fishing Report), HDAR Commercial Marine Dealer's Report data (Dealer), and NMFS, Pacific Islands Fisheries Science Center's (PIFSC) longline logbook data.

Any fisherman who takes marine species for commercial purposes is required by HDAR to have a CML and submit a monthly catch report. An exception to this rule is that should a fishing trip occur on a boat, only one person per vessel is required to submit a catch report. This person is usually, but not necessarily, the captain. Crew members do not ordinarily submit catch reports. HDAR asks fishermen to identify their primary fishing gear or method on the CML at time of licensing. This does not preclude fishermen from using other gears or methods. Data sources and estimation procedures are described below.

**The Hawai'i-permitted Longline Fishery:** The federal longline logbook system was implemented in December 1990 and it is the main source of the data used to determine longline vessel activity, effort, fish catches and catch-per-unit-effort (CPUE). Logbook data have detailed operational information and catch in number of fish. Longline vessel operators are required to declare whether they will be making a deep-set or shallow-set trip prior to their departure. A deep-set is defined as a set with 15 or more hooks between floats as opposed to a shallow-set that is characterized by setting less than 15 hooks between floats.

Number of fish caught by Hawai'i-permitted longline fishery is a sum of the number of fish kept and released whereas the calculation of weight for longline catch only includes the number of fish kept. Another important data set is the HDAR Commercial Dealer data. Dealer data dates back to 1990 with electronic submission beginning in mid-1999. Revenue, average weight and average price are derived from the Dealer data.

The logbook and Dealer data were used to calculate the weight of longline catch. Longline purchases in the Dealer data was identified and separated out by matching longline trips based on a specific vessel name and its return to port date in the logbook data with the corresponding vessel name and purchase date(s) in the Dealer data. The general procedure of estimating longline catch for each species was done by first calculating an average weight by dividing the longline Dealer data "LBS. BOUGHT" by the "NO. BOUGHT". This average weight was multiplied by the total number kept from the longline logbook data to estimate the total weight of catch kept. Revenue was the simple sum of "AMOUNT PAID" from the Dealer data based on longline trips which were matched with logbook data. Swordfish are processed at sea and landed headed and gutted. Tunas and mahimahi that weighed more than 20 lbs and marlins greater than 40 lbs must be gilled and gutted prior to sale. A conversion factor is applied to processed fish to estimate whole weight. Average weight statistics were calculated separately for the deep-set and shallow-set longline fisheries. Each species needed a minimum of 20 samples within a month of each RFMO area, i.e., WCPO or EPO, in order to calculate a mean weight. If this criterion was not met, the time strata was increased to a

quarter, year or multi-year period until there were enough samples to calculate a mean weight. Some species which were landed in low numbers needed to be aggregated to a multi-year period. Consequently, their respective annual mean weights are the same from year to year or repeat over time.

Catch and effort summaries in this Module were based on RFMO standards and business rules. Longline catch and efforts statistics in this Module consists of U.S. longline fisheries in the North Pacific Ocean, attributions from CNMI, Guam and American Samoa in the North Pacific Ocean. Longline vessels operating from California were also included in this report to satisfy RFMO data reporting and NOAA confidentiality standards. Most of these vessels had Hawai`i limited-entry permits. The only exception to summaries using RFMO standards was catch and effort statistics using boundaries within or outside of U.S. EEZs. Since there were substantial differences in operational characteristics and catch between the deep-set longline fishery targeting tunas and the shallow-set longline fishery targeting swordfish, separate summaries were provided for each longline fishery.

**MHI Troll Fishery:** Catch and effort by the MHI troll fishery was defined as using a combination of pelagic species, gear and area codes from the HDAR Fishing Report data. The HDAR codes for the MHI troll fishery includes summaries of PMUS caught by Miscellaneous Trolling Methods (gear code 6), Lure Trolling (61), Bait Trolling (62), Stick Trolling (63), Casting, Light Tackle, Spinners or Whipping (10) and Hybrid Methods (97) in HDAR statistical areas 100 through 642. These are areas that begin from the shoreline out to 20 minute squares around the islands of Hawai`i, Maui, Kahoolawe, Lanai, Mokolai, Oahu, Kauai and Niihau.

**MHI Handline Fishery:** The MHI handline fishery includes PMUS caught by Deep Sea or Bottom Handline Methods (HDAR gear code 3), Inshore Handline or Cowrie Shell (Tako) Methods (4), Kaka line (5), Ika\_Shibi (8), Palu-Ahi, Drop Stone or Make Dog Methods (9), Drifting Pelagic Handline Methods (35) and Floatline Methods (91) in HDAR statistical areas 100 to 642 except areas 175, 176, and 181.

**Offshore Handline Fishery:** The offshore handline fishery includes PMUS caught by Ika-Shibi (HDAR gear code 8), Palu-Ahi, Drop Stone or Make Dog Methods (9), Drifting Pelagic Handline Methods (35), Miscellaneous Trolling Methods (6), Lure Trolling (61), and Hybrid Methods (97) in Areas 15217 (NOAA Weather Buoy W4), 15717 (NOAA Weather Buoy W2), 15815, 15818 (Cross Seamount) , 16019 (NOAA Weather Buoy W3), 16223 (NOAA Weather Buoy W1), 175, 176, 181, 804, 807, 816, 817, 825, 839, 842, 892, 893, 894, 898, 900, 901, 15416, 15417, 15423, 15523, 15718, 15918, 15819, and 16221. This fishery also includes pelagic species caught by Deep Sea or Bottom Handline Methods (3) in Area 16223.

**Other Gear:** This category represents pelagic species caught by methods or in areas other than those methods mentioned above. Catch and revenue from this category is primarily composed of PMUS caught by the aku boat fishery, fishers trolling in areas outside of the MHI (the distant water albacore troll fishery) or PMUS caught close to shore by diving, spearfishing, squidding, or netting inside of the MHI.

**Calculations:** Pelagic catch by the MHI troll, MHI handline, offshore handline, and other gear were calculated by summing “Lbs LaBS LANDED” from the HDAR Fishing Report data based on the gear and area codes used to define each gear type. The percent of catch for each pelagic species was calculated from the “LBS LANDED” by the MHI troll, MHI handline offshore handline and other gear and used to estimate the “LBS SOLD” and revenue of each fishery.

Catch in the HDAR Dealer data, referred to as “LBS. BOUGHT”, by each fishery was not clearly differentiated however, “LBS. BOUGHT” by the longline and aku boat fisheries were identified by CML numbers and/or vessel names and kept separate from the “non-longline & non-aku boat” Dealer data. This remaining “LBS. BOUGHT” along with the “AMOUNT PAID” from Dealer data for the “non-longline and non-aku boat” fisheries was used to calculate average weight, revenue and average price for the MHI troll, MHI handline, offshore handline fisheries and other gear category. “LBS. BOUGHT” from this Dealer data was summed on a species specific basis. The percent of catch calculated from the HDAR Fishing Report “LBS LANDED” for each species and by each fishery was used in conjunction with total “LBS. BOUGHT” from the HDAR Dealer data to apportion “LBS. BOUGHT” and “AMOUNT PAID” or revenue accordingly to each respective fishery. This process was repeated on a monthly basis to account for the seasonality of catch and variability of activity for each fishery. Revenue and average price are inflation-adjusted by the Honolulu CPI.

### **1.1.2 SUMMARY OF HAWAII PELAGIC FISHERIES**

The following is a summary of effort, catch, CPUE, size of fish, revenue and bycatch for the main pelagic fisheries (deep set and shallow set longline, MHI troll, MHI handline, and offshore handline).

**Participation.** A total of 3,124 fishermen were licensed in 2019, including 1,929 (62%) who indicated that their primary fishing method and gear were intended to catch pelagic fish. This is a 6% decrease in fishing licenses from the previous year. Most licenses that indicated pelagic fishing as their primary method were issued to longline fishermen (46%) and trollers (40%). The remainder was issued to ika shibi and palu ahi (handline) (14%).

**Catch.** Hawai`i commercial fisheries caught and landed 36.5 million pounds of pelagic species in 2019, a decrease of 3% from the previous year. Although each fishery targets or intends to catch a particular pelagic species, a variety of other species were also caught. The deep-set longline fishery targeted bigeye and yellowfin tuna. This was the largest of all pelagic fisheries and its total catch comprised 87% (32.0 million pounds) of all pelagic fisheries. The shallow-set longline fishery targeted swordfish and its catch was 837,000 pounds, or 2% of the total catch. The main Hawai`i Islands troll fishery targeted tunas, marlins and other PMUS caught 2.5 million pounds or 7% of the total. The MHI handline fishery targeted yellowfin tuna while the offshore handline fishery targeted bigeye tuna. The MHI handline fishery accounted for 675,000 pounds (2% of the total). The offshore handline fishery was responsible for 477,000 pounds or 1% of the total catch.

The largest component of the pelagic catch was tunas, which comprised 68% of the total in 2019. Bigeye tuna alone accounted for 72% of the tunas and 49% of all the pelagic catch. Billfish catch made up 16% of the total catch in 2019. Blue marlin was the largest of these, at 41% of the billfish and 6% of the total catch. Catches of other PMUS represented 16% of the total catch in 2019 with moonfish being the largest component at 37% of the other PMUS and 6% of the total catch.

**Effort.** There were 150 active Hawai`i-permitted deep-set longline vessels in 2019, seven more vessels than the previous year, with 140 or more deep-set vessels in the past 5 years. The number of deep-set trips (1,724) and sets (22,513) were both deep-set effort records. The number of hooks set by the deep-set longline fishery reached a record 63.2 million hooks in 2019. The Hawai`i-permitted shallow-set longline fishery operates mainly in the first half of the year. In 2019, 14 vessels completed 25 trips and made 284 sets, which was significantly lower effort for this segment of the fishery due to the closure of the fishery in March as a result of reaching the loggerhead sea turtle interaction limit. The number of hooks set by this fishery also decreased to 400,000 in 2019, a record low since the reopening of the shallow-set fishery in 2004. The number of days fished by MHI troll fishers has been trending lower from its peak in 2012, with 1,291 fishers logging 20,359 days fished around the MHI in 2019. There were 438 MHI handline fishers that fished 3,629 days in 2019, both at their lowest levels in the ten-year period. The offshore handline fishery had 7 fishers and 261 days fished in 2019.

**CPUE.** The deep-set longline fishery targets bigeye tuna and this species had higher CPUE (3.5 fish per 1,000 hooks) compared to yellowfin tuna (1.0) and albacore (0.1). CPUE of blue marlin and striped marlin for the deep-set fishery were low (0.2 and 0.3 fish per 1,000 hooks, respectively), while the CPUE for blue shark, a bycatch species, is second only to bigeye at 1.8 fish per 1,000 hooks. The Hawai`i-permitted shallow-set longline fishery targets swordfish and had a CPUE of 9.8 fish per 1,000 hooks in 2019 followed by blue shark, a bycatch species of this fishery, with a CPUE of 8.5 fish per 1,000 hooks. The 2019 MHI troll fishery CPUE for yellowfin tuna was above the long-term average with blue marlin at a 10-year high CPUE. Mahimahi and ono CPUE were both above their long-term average in 2019. MHI handline CPUE for yellowfin, albacore and bigeye tuna were all below their long-term mean weights in 2019. Bigeye tuna CPUE for the offshore handline fishery increased from 2017 while yellowfin tuna decreased during the same time period.

**Fish Size.** The average weight for most tunas species caught by the deep-set longline fishery were close to their respective long-term weights in 2019. Bigeye tuna caught in the deep-set fishery was 79 lbs in 2019, close to the long-term average. The size of swordfish was much higher from 2017 while marlins were below their respective long-term average weights in 2019. The mean weight of other PMUS and PMUS sharks were close to their respective long-term average weights. Swordfish caught by the shallow-set longline fishery was 217 pounds, well above the 10-year average. In general, the average weight of most fish caught by the shallow-set longline fishery is higher than fish caught by the deep-set longline fishery. The average weight for tunas caught by the troll and handline fisheries was close to their long-term average in 2019. Troll and handline caught blue marlin was below its long-term mean weight.

**Revenue.** The total revenue from Hawaii's pelagic fisheries was \$105.6 million in 2019, a decrease of 11% from the previous year. Bigeye tuna and yellowfin tuna represented 60% and 20% of the total pelagic revenue, respectively in 2019. The deep-set longline revenue was \$92.9 million in 2019. This fishery represented 88% of the total revenue for pelagic fish in Hawaii. The shallow-set longline fishery decreased to \$2.0 million and accounted for 2% of the revenue. The MHI troll revenue was \$7.2 million or 7% of the total in 2019 and was followed by the MHI handline fishery at \$2.2 million (2%). The offshore handline fishery was worth \$1.0 million in 2019. The trend for revenue from the deep-set longline was increasing although it dropped 11% in 2019. Revenue for the shallow-set longline fishery was decreasing. The revenue from the MHI troll, MHI handline and offshore handline fishery showed some variability and no clear trend over the past ten years.

**Bycatch.** A total of 144,677 fish were released by the deep-set longline fishery in 2019. Sharks accounted for 87% of the deep-set longline bycatch. With the exception for mako and a few thresher sharks, there is no demand for other shark species in Hawaii. Of all shark species combined, 99.6% of the deep-set longline shark catch was released. Conversely, bycatch rate for the deep-set longline fishery was only 3% for targeted and incidentally caught pelagic species in 2019. A total of 3,286 fish were released by the shallow-set longline fishery in 2019. Sharks accounted for 94% of the shallow-set longline bycatch. With the exception for mako shark, there is almost no demand for sharks in Hawaii. Of all shark species combined, 97% of the shallow-set longline shark catch was released. Conversely, bycatch rate for the shallow-set longline fishery was 4% for targeted and incidentally caught pelagic species in 2019. Since shallow-set longline trips are often longer than deep-set trips, the higher release rate by the shallow-set sector is to conserve space for swordfish and forego keeping other pelagic species due to their short shelf life.

### **1.1.3 PLAN TEAM RECOMMENDATIONS**

The recommendations by the Pelagic Plan Team for the Hawaii Module in the 2018 SAFE Report were:

1. .

#### **1.1.4 OVERVIEW OF PARTICIPATION – ALL FISHERIES**

**Table 1. Number of HDAR Commercial Marine Licenses, 2018-2019.**

<b>Primary Fishing Method</b>	<b>Number of licenses</b>	
	<b>2018</b>	<b>2019</b>
Trolling	826	775
Longline	887	894
Ika Shibi & Palu Ahi	267	258
Aku Boat (Pole and Line)	2	2
Total Pelagic	1,982	1,929
Total All Methods	3,308	3,124

### 1.1.5 OVERVIEW OF CATCH AND ECONOMIC DATA

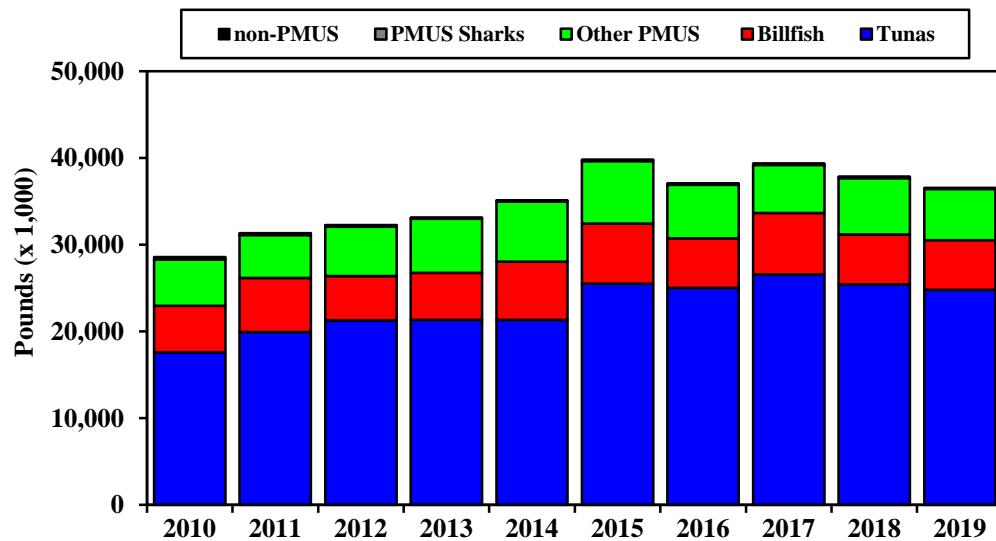

**Table 2. Hawai‘i commercial pelagic catch, revenue, and average price by species, 2018–2019.**

Species	2018			2019		
	Catch (1,000 lbs)	Ex-vessel revenue (\$1,000)	Average price (\$/lb)	Catch (1,000 lbs)	Ex-vessel revenue (\$1,000)	Average price (\$/lb)
<b>Tuna PMUS</b>						
Albacore	239	\$399	\$1.82	255	\$488	\$1.82
Bigeye tuna	17,093	\$67,520	\$4.24	17,758	\$63,508	\$3.87
Bluefin tuna	1	\$27	\$8.53	4	\$65	\$5.78
Skipjack tuna	530	\$658	\$1.79	828	\$815	\$1.27
Yellowfin tuna	7,567	\$26,821	\$3.73	5,952	\$20,565	\$3.54
Other tunas	10	\$18	\$3.02	10	\$17	\$3.14
<b>Tuna PMUS subtotal</b>	<b>25,439</b>	<b>\$95,443</b>	<b>\$4.02</b>	<b>24,807</b>	<b>\$85,457</b>	<b>\$3.69</b>
<b>Billfish PMUS</b>						
Swordfish	2,329	\$3,762	\$2.16	1,625	\$3,801	\$2.55
