Forage Fish in the Western Pacific

Forage fish, also called prey or bait fish, are small fish and invertebrates eaten by larger fish, seabirds and marine mammals. Many species are short-lived and their abundance is often sensitive to environmental variables. Forage fish are not currently defined in the Western Pacific Council’s Fishery Ecosystem Plans. However, two species that could be considered forage fish are big eye scads (akule, *Selar crumenophthalmus*) and mackerel scads (‘śōpelu, *Decapterus macarellus*). Other species, such as Hawaiian anchovy (nehu, *Encrasicolina purpurea*) and squid, could also be considered forage fish, but additional funding and research is needed.

Since 2019, akule and ‘śōpelu have been classified as “ecosystem component species” instead of “management unit species.” Stock assessments, annual catch limits and essential fish habitat designations are no longer required, but catches are closely monitored.

The Council is working with partners to develop near-shore ecosystem models that consider the biomass and productivity of forage fish species as drivers. The Council also funded cooperative research using aerial surveys to better understand forage fish spatial and temporal patterns around O‘ahu, Hawai‘i. The surveys create a fishery-independent baseline that improves the stock’s assessment.

Although akule are prey items, they are also a targeted species important in Hawai‘i, American Samoa (atule) and the Mariana Archipelago (atulai). Akule are consistently the top species harvested in the main Hawaiian Islands due to the large quantities caught with certain gear types (purse seine, seine and gill nets), and persistent high demand from local markets. Akule is also an important species culturally for native Hawaiians. Communities conduct a hukilau—a method of fishing in which many people corral the school using ropes with ti leaves or a net—and scoop the fish out of shallow reef areas. The participating families and friends share the catch.

A Council Authorized by the Magnuson-Stevens Fishery Conservation and Management Act of 1976

1164 BISHOP ST • SUITE 1400 • HONOLULU, HI 96813 USA • TEL (808) 522-8220 • FAX (808) 522-8226 • www.wpcouncil.org
Aerial abundance indices – biomass estimate (pounds) divided by search area (square mile) – for big eye scad (akule) surrounding the island of O‘ahu from November 2015 – October 2016, separated by season: (A) Beginning (Nov–Jan), (B) Middle (Feb–April), (C) Peak (May–July), (D) End (Aug–Oct). Numbered areas represent Hawai‘i commercial fishing grids.
